Since its establishment, YunTech has completed a comprehensive campus planning document and has established guidelines for campus environmental design. These guidelines not only cover basic layout and architectural styles but also dictate specific design standards for landscaping and plant selection in different areas, such as roads, parking lots, plazas, courtyards, and sports fields. In terms of plant selection, the principles align with Taiwan's subtropical climate and regional characteristics, favoring easy-to-maintain and drought-resistant species to minimize water resource demands. Recycled water is used for irrigation as part of our ongoing commitment to a green and environmentally friendly campus.

Since its inception, YunTech has been dedicated to fostering a sustainable campus. Within the total area of 581,241.09 square meters, there are a total of 6,989 trees planted (5,526 large trees and 1,463 small trees), covering approximately 235,511 square meters. The grassy areas account for 174,798.76 square meters; green walls and rooftop gardens cover 37,500 square meters; and sports fields with turf approximately 25,546 square meters. In total, this amounts to 473,355.76 square meters, representing about 81.43% of the campus area, showcasing an outstanding coverage rate of plant species across the campus.
